

SAMUEL PIETRA

Belo Horizonte Brazil | +55 31 9 9831-0341 | samuelpietra@outlook.com

Professional Summary

Senior Frontend Engineer | React | TypeScript | JavaScript | 8+ years delivering scalable web applications.

I thrive at the intersection of engineering and design — where component architecture, developer experience and visual consistency converge. I leverage AI-augmented workflows to consistently accelerate delivery without compromising code quality or architectural integrity.

Skills

- Typescript
- JavaScript
- Design System
- Styled Components
- State Management
- React.js
- Vite.js
- Storybook
- Unit Testing
- Node.js

Work History

Senior Software Engineer

Dec 2024 - Current

MTab

California, United States

- Redesigned a complex reporting interface end-to-end — from React UI to RESTful API layer — serving 1,300+ enterprise customers including Fortune 500 brands such as Ford, Netflix and Disney. Refactored filtering, sorting and bulk actions logic while preserving full backward compatibility, delivering measurable reduction in processing time and improving overall content management UX at scale.
- Rescued a critically degraded Storybook icon library (1,700+ Lucide Icons) that was freezing browsers under sequential rendering load. Implemented React's useDeferredValue to debounce search input and a custom polling hook to batch-render 50 icons every 100ms — each wrapped in React.Suspense with a loading fallback — fully restoring usability with zero architectural overhaul.
- Replaced a legacy FTP-based upload flow — previously restricted to admin users — with a modern file upload system built under Fluent UI standards, expanding access to 5,000+ platform users for the first time. Delivered drag-and-drop, progress tracking and asynchronous bulk upload with format/size policy enforcement, image preview and cropping — all governed by TypeScript-typed feature flags for safe, incremental rollout.

Software Engineer

Mar 2021 - Dec 2024

Localiza&Co

Belo Horizonte, Brazil

- Led the development of a scalable enterprise design system using Figma and Storybook, utilized across 20+ products. Guided the creation of custom React.js and React Native hybrid styled components with TypeScript, adopting Design-Driven Development (DDD) to ensure consistency and enhance User Experience (UX). Applied snapshot and unit testing for seamless integration and reliability.
- Built from scratch a mobile-first React.js platform that digitized a paper-based vehicle inspection workflow across 32 branches (~200 employees), saving an estimated \$10,000/month in operational costs. Replaced printed forms and manual handoffs with a seamless digital flow integrating photo capture, damage reporting and contract management, backed by AWS S3 image upload and Amplitude analytics.
- Built from scratch a B2B backoffice dashboard as part of Localiza's strategic initiative to decouple from a 20+ year-old legacy system — supporting 45,000+ simultaneous active contracts. Delivered vehicle status management, fine and damage billing, and fleet substitution workflows for front desk operations. Migrated CRA to Vite, reducing build times by ~85% on low-spec corporate hardware, with CI/CD pipelines on Azure.

Software Engineer

Dec 2019 - Mar 2021

SimpleLab

Belo Horizonte, Brazil

- Migrated legacy React.js class components to functional components, modernizing the codebase while preserving existing UX flows and enabling adoption of latest React patterns and tooling.
- Developed reusable, offline-first modules with React and Node.js, delivering resilient RESTful APIs integrated with MongoDB and TypeScript-based Mongoose ORM for construction management products.

Education

Bachelor of Science: Computer Science

Jan 2019

PUC Minas

Belo Horizonte, Brazil
